Submitted To: MA'AM RIDA

ASSIGNMENT 3:

Description: First we have to make XML DOM which specifies the characteristics and methods for accessing and editing XML (Document Object Model). However, in order to access an XML document, an XML DOM object must first be loaded.

In this XML assignment, we've created an array with the name of a book list, and after that, we append the attributes (BOOK, AUT NAME,TIT,GETRE,PRI,PUBLISH,DES), and then we switch the compiler to the right mode and create a CSV file, where we again create the attributes (BOOK, AUT NAME,TIT,GETRE,PRI,PUBLISH,DES) and perform the append function.

When the process is finished, a file with the name we gave it while creating it is created in our project, and the final output is then saved in.
